How to secure a successful PKI migration

PKI migration is nothing to be trifled with but this road map should give you some “food for thought”. And remember, you are not alone. Please let us know, the PrimeKey team is just a phone call away.

Although the reasons for migration differ, there are three main ones:

End of a relationship – this could be caused by the end of the life of the current product, the end of the contractual relationship, or, in extreme situations, dissatisfaction with the current vendor.

Compliance and regulations – as the various verticals (fields) evolve, we witness more new compliance and regulatory requirements emerging. There can be multiple requirements for a PKI product; for example, a need for certain novel features, demonstrably strong audit trails, the enforcement of a new policy or new administrative processes.

Limitations of the Business Model or Technology – anything that hampers the growth of the organisation. In many instances, we can identify scalability and performance as factors in the decision, but also a simple thing, such as adding a new type of service, may require extraordinary investments in new infrastructure, licences, etc. Another reason that our new customers have given us is that they have felt locked in and were unable to integrate with other services or products.

PrimeKey Solutions is the inventor and custodian of EJBCA®, the world’s most downloaded open source enterprise PKI. PrimeKey EJBCA has gained the trust of Fortune organisations, enterprises, governments and many others. That is why PrimeKey is well positioned to secure your data, code and privacy.
